POSITION STATEMENT

Why the NCAA Academic Progress Rate (APR) and the Graduation Success Rate (GSR) should be Abandoned and Replaced with More Effective Academic Metrics

EXECUTIVE SUMMARY

The Drake Group conducted a comprehensive assessment of the strengths and weaknesses of current academic progress standards for participation in college athletics. Our purpose was to determine whether these standards effectively measure success in college, and we found a significant need for reform. The Drake Group found that NCAA academic measures are often public relations “smokescreens,” hiding widespread exploitation of academically underprepared athletes and academic fraud by institutions chasing financial success in Division I athletics. The Drake Group identified no easy or single solution to this failure of academic standards. The NCAA must impose multiple reforms simultaneously to hold institutions and coaches accountable for the academic success of recruited athletes.

Specifically, the NCAA should discontinue its use of the Graduation Success Rate, Academic Progress Rate, and Coaches Academic Success rate calculations because they are fundamentally flawed metrics that (1) do not permit comparison with non-athlete students, (2) do not recognize institutional

---

2 The Drake Group is a national organization of faculty and others whose mission is to defend academic integrity in higher education from the corrosive aspects of commercialized college sports. The Drake Group goals include: (1) ensure that universities provide accountability of trustees, administrators, and faculty by publicly disclosing information about the quality of educations college athletes receive; (2) advance proposals that ensure quality education for students who participate in intercollegiate athletics; (3) support faculty and staff whose job security and professional standing are threatened when they defend academic standards in intercollegiate sports; (4) influence public discourse on current issues and controversies in sports and higher education; and (5) coordinate local and national reform efforts with other groups that share its mission and goals. The Drake Group is “In residence” at the University of New Haven. For further information see: http://thedrakegroup.org or contact Gerald S. Gurney, President at geraldgurney@gmail.com
differences in mission, classroom competitiveness, and student quality or the effect of these factors on underprepared college athletes and (3) invite academic fraud when mismatched recruits are denied appropriate remediation through academic support services. Alternatively, the Drake Group proposes eight academic reforms that would hold NCAA member schools and coaches accountable for recruiting athletes capable of graduating and for remediying academic deficiencies that might otherwise make graduation unlikely.

INTRODUCTION

One of the NCAA’s stated basic principles for the conduct of intercollegiate athletics is:

**2.5 The Principle of Sound Academic Standards.**

Intercollegiate athletics programs shall be maintained as a vital component of the educational program, and student-athletes shall be an integral part of the student body. The admission, academic standing and academic progress of student-athletes shall be consistent with the policies and standards adopted by the institution for the student body in general.³

For more than 50 years, the NCAA has wrestled with the issue of minimum academic eligibility requirements for intercollegiate athletic participation. The Association has created and modified standards for initial eligibility at member institutions for athletes entering from high school or junior college, or transferring from 4-year institutions. It has also created and modified standards for continuing eligibility once the athlete is enrolled at an institution. Over time, these standards and their chosen metrics have ceased to compare athletes to their non-athlete peers. The standards have also failed to consider institutional characteristics that may affect an athlete’s ability to succeed academically. The departure of NCAA academic metrics from sound academic standards has created a negative correlation: as athlete exploitation increases, the academic integrity of the member institution decreases, subjugating the institution to media and public scrutiny.

The NCAA created the Graduation Success Rate (GSR) and the Academic Progress Rate (APR) to minimize the potential negative headlines resulting from reporting lower graduation rates for athletes compared to non-athletes. The APR aims to be a real-time predictor of GSR; it is supposed to allow the institution to track the athlete’s progress toward graduation. These independent metrics allowed the NCAA to avoid raising the academic standards required to participate in athletics. They also allowed the NCAA to publish misleading information regarding the academic success of athletes compared to non-athletes. Contrary to the NCAA’s suggestion, the measures used to compare athletes and non-athletes are not equivalent because they account for differing variables in their calculations.

In 2010, the NCAA developed and implemented an additional reform measure, the Coaches’ APR. This measure was intended to hold coaches accountable for the academic performance of their athletes. It sought to provide a public-exposure incentive for coaches to recruit and retain academically qualified athletes. Unfortunately, using this measure has not resulted in improved graduation rates. Instead, it has provided student-athletes and athletics staff the impetus to perpetrate academic fraud, sacrificing institutional integrity in a classic example of an unintended consequence of a policy decision.

Throughout the history of collegiate athletics, the NCAA has used flawed metrics to measure the academic success of college athletes. It has skewed the numbers to overstate performance. It then touts its academic reforms, even though the evidence suggests otherwise. For instance, national trends exist toward rising graduation rates for college students, grade inflation, and the creation of less rigorous majors. Perhaps more alarming is the NCAA’s failure to mention that graduation rates and academic performance measures for Division I football and men’s basketball are significantly below those of the general student body and other non-revenue college athletes.

Not all of the NCAA’s academic standards apply to all NCAA membership divisions (Division I, II and III). For purposes of this analysis, we examined only Division I standards and results, recognizing that revenue growth and perceived publicity benefits enjoyed by successful athletic programs in this division have created huge pressures to keep athletes eligible, often resulting in abuses to “beat” the academic metric.

This report aims to (a) enhance the reader’s understanding of college athlete eligibility and success standards, (b) identify the strengths and weaknesses of these standards, and (c) recommend how the NCAA should measure academic success. Further, The Drake Group will examine whether the NCAA and institutions are using academic progress measures as public relations smokescreens, hiding underachievement, exploitation, and academic fraud by institutions focused on the financial success of Division I athletic programs, their coaches, and administrators.

**NCAA ACADEMIC MEASURES: DEFINITIONS – HISTORY – EFFECTIVENESS - ALTERNATIVES**

**Initial Eligibility Standards – High School Students**

In 2003, the NCAA enacted the most recent set of initial eligibility reforms for high school students entering its member institutions, which actually lowered academic standards. A high school student was required to have completed 16 core courses with a minimum GPA of 2.0, to have earned a corresponding minimum standardized test score on a sliding scale, and to have graduated from high school. Theoretically, a student could fail every question on a standardized test and still qualify. Previously, a minimum composite score of 17 on the ACT or 820 on the SAT was required. The sliding scale was a response to the criticism that standardized-exam requirements disproportionately disqualify minority athletes from eligibility.\(^4\) The stated purpose of the 2003 initial eligibility changes was to increase the number of minority athletes who graduate from college. The actual results have been:

- Lower test-score standards, coupled with high-school grade inflation, resulting in more athletes who meet NCAA eligibility standards with very low-test scores. These students possess inadequate skills to manage college academics, increasing the need for academic-support services at institutions already struggling with tight budgets.\(^5\)

- Negligible gains in minority access to higher education through big-time college sports. The NCAA’s ‘Student-Athlete Ethnicity Report’ included as variables the participation rates of self-reported ethnicity classifications, by team, each year from 1999 to 2009. It revealed that the adoption of less rigorous eligibility standards had minimal impact (positive) on African-American access to participation in football and basketball. Rarely mentioned is that for four years leading

\(^5\) Ibid.
up the 2003 reforms, number of minority participants who met the higher minimum test score standard had increased steadily. Between 1999 and 2002, the African-American participation rate in Division I men’s basketball increased 2.9 percentage points, from 55.0 to 57.9 percent. But between 2003 and 2009, after the reforms, it rose only three points, to 60.9 percent. The same growth trend was evident in football: between 1999 and 2002, African-American participation increased from 39.5 percent to 43.8 percent, but between 2003 and 2009, it increased only two points, to 45.8 percent. According to the NCAA’s reports on federal graduation rates of African-American student-athletes in Division I, the most recent data for men’s basketball revealed a one-point decline in the 2003 cohort, to 43 percent, and for football a one-point increase, to 48 percent, over the previous year.  

- Removing the minimum standardized test requirement has challenged the academic integrity of higher education by widening the gap between the average academic profiles of athletes and non-athletes. The result is a depreciation of a “degree’s worth,” coupled with an invitation to institutions to maintain an athlete’s eligibility by committing academic fraud. This academic fraud includes counseling underprepared athletes to: (1) enroll in less-demanding academic majors, (2) select the least demanding courses available regardless if they are needed to earn a degree, (3) enroll in courses with faculty who are “easy” graders or who require little to no work to complete course requirements, and (4) participate in acts of academic dishonesty in conjunction with academic tutors, coaches, and staff members hired by the athletic department. As a result, member institutions fail to provide their athletes with a meaningful education. The richest athletic programs have developed multi-million-dollar academic support programs, hiring academic support professionals and counselors who focus on keeping athletes eligible.

- At the high school level, preparatory schools now offer higher GPAs at a price. The result is massive grade inflation, as individuals have learned the system and recognize that an artificially high GPA can negate a poor performance on a standardized test.

- As of August, 2016, the NCAA will raise to 2.3 the minimum grade point average for eligibility to practice, compete, and receive financial aid and will require the completion of 10 core units prior to the start of the college athlete’s senior year.

- The Association also created an Academic Redshirt year from competition for college athletes who would otherwise qualify under the former GPA/test score sliding scale. The athlete who fails to meet minimum 2.3 GPA is eligible for financial aid, has no restrictions on practice time, and is not required to seek remediation or academic support.

The NCAA membership should reinstate the minimum standardized-test scores of 17 composite on the ACT and 820 combined verbal and math on the SAT for freshman athletics eligibility. This requirement is necessary to establish minimum reading and mathematics capabilities for incoming students. It would ensure that college athletes have at least rudimentary academic skills or, at a minimum, would require institutions to apply their own entrance requirements equally to both athletes and non-athletes. Absent minimum scores on standardized tests, institutions must address the admission of underprepared athletes in some other rational way. Otherwise, they will continue to exploit predominantly minority football and men’s basketball players, and academic fraud designed to keep athletes eligible to play will

---

6 The first year for which the NCAA provides data is 1999.
7 Ibid. Of course, another factor possibly affecting these numbers is that the percentage-point increase may occur more readily when the starting level is lower.
8 2015-2016 NCAA Division 1 Manual pages 155-161
Recommendation 1 – Require Institutional Match for Initial Eligibility of High School Students

Any student whose academic profile (high school grade point average and standardized test score) is more than one standard deviation below the mean academic profile (based on high school grade-point averages and standardized test scores) of the previous year’s incoming class at the recruiting institution should be ineligible for athletic participation during the freshman year. The institution that admits the athlete must provide: (1) athletic scholarship assistance during the year of transition; (2) academic skills and learning disability testing; (3) if necessary, a remediation program supervised by academic authorities; (4) a reduced for-credit course load to accommodate the time required for remediation; (5) a 10 hour per week participation restriction applicable to athletics-related activities (practice, meetings, etc.); and (6) tenured faculty oversight of the student’s academic progress throughout his or her enrollment at the institution.9

Initial Eligibility Standards – Junior College Transfers

The most recent reforms became effective in August of 2012. To be immediately eligible to participate upon transfer to an NCAA member institution, a student must have attended a two-year college full time for at least one semester or quarter. The student must also have earned an average of at least 12-semester or quarter credit hours for each full-time term at the two-year college and at least a 2.500 GPA in all transferable hours including no more than two physical education activity credit hours from the two-year college to meet the requirements for immediate eligibility.

The NCAA summarized key research findings regarding 2 year college transfers to NCAA member institutions as follows:

- Two-four transfer students enter NCAA Division I schools with lower high school grades and test scores than other groups of students.
- Two-four transfers leave college ineligible at higher rates than any other group of student-athletes.
- Two-four transfer graduation rates lag behind those of student-athletes who enter a Division I school from high school.
- The grade-point average at the two-year institution is the best predictor of all first-year outcomes examined.
- Ineligibility rates decrease significantly as grade-point averages earned at two-year institutions increase.

▪ Student-athletes with more core academic credits\textsuperscript{10} perform better at four-year institutions. Science is a strong predictor.

▪ Students with a high number of physical education activity credits tend to have less academic success at the four-year institution than their two-year institution grade-point average would predict.

▪ Generally, data pertaining to high school academic performance do not add appreciably to the prediction equation once academic behavior at the two-year institution is known.\textsuperscript{11}

---

**Recommendation 2 – Carefully Monitor the New Higher Standards Governing Initial Eligibility of 2-Year College Transfers**

Based on the above information, athletics administrators and the NCAA should pay particular attention to the new rule requiring a 2.5 cumulative GPA to transfer from a 2-year institution to a four-year institution. They should monitor this rule to ensure it fosters success at 4-year colleges. Those with a vested interest in academic integrity should consider requiring the student to graduate from junior college or meet the normal transfer admission standards of the four-year institution. The following academic profile rule should be implemented:

Any student whose academic profile (high school grade point average and standardized test score) is more than one standard deviation below the academic profile of the four year institution’s entering class of the previous year should be ineligible for athletic participation IF that result stands when compared to the academic profile of the incoming transfer class. Under these circumstances, the institution should provide: (1) athletic scholarship assistance to support the athlete during the transition; (2) academic skills and learning disability testing; (3) if necessary, a remediation program supervised by academic authorities; (4) if necessary, a reduced for-credit course load to accommodate the time required for remediation; (5) a 10 hours per week participation restriction applicable to athletics (practice, meetings, etc.); and (6) oversight by tenured faculty of the student’s academic progress while enrolled at the institution.\textsuperscript{12}

---

**Initial Eligibility Standards – Four-Year College Transfers**

Currently, the NCAA specifies that if the transfer student attended the previous 4-year institution for at least one year, met progress-toward-degree requirements at the previous four-year institution at the time of transfer, and was academically eligible to return to the previous institution and participate in athletics,\textsuperscript{10} New NCAA academic standards were implemented on August 1, 2016. These standards require the completion of ten core courses before the beginning of the senior year. A description of core academic credit can be found at: [http://www.nacacnet.org/research/KnowledgeCenter/Documents/NewNCAARequirements.pdf].
\textsuperscript{11} National Collegiate Athletic Association. (2012) Two-Year Transfer Summit. A power point presentation at the 2012 Mesa College Two-Year Transfer Summit. Presentation by Jennifer Strawley and Diane Dickman.
that student is immediately eligible to participate. The Drake Group does not recommend a change in this provision.

**Recommendation 3 – Close the 4-Year to 4-Year Transfer Loophole**

If the transfer student attended the previous four-year institution for less than one academic year, did not previously graduate from junior college, and the student's academic profile (high school grade point average and standardized test score) is more than one standard deviation below the academic profile of the four-year institution's class that corresponds with the transfer student’s class, the student is ineligible for athletic participation during the first year at the four-year institution. The institution that admits the athlete must provide (1) athletic scholarship assistance during the year of transition and remedial learning if necessary; (2) academic skills and learning disability testing; (3) if necessary, a remediation program supervised by academic authorities; (4) if necessary, a reduced for-credit course load to allow time for remediation; (5) a 10 hours per week participation restriction applicable to athletics (practice, meetings, etc.); and (6) oversight by tenured faculty of the student's academic progress while enrolled at the institution.13

**Continuing Eligibility Standards – GPA and Satisfactory Progress**

The NCAA currently requires continuing academic eligibility standards, as depicted in Table 1 on the next page. These standards disregard the current high school standard required for initial eligibility: a cumulative GPA of 2.0. When universities require students to remain in “good academic standing,” they often use as a floor the minimum acceptable GPA required for graduation within a particular major. At the sophomore level many institutions allow athletes to participate with a 1.8 cumulative GPA. Considering the time and energy constraints associated with playing a sport in college, to permit the adoption of a lower standard during college than is required for initial eligibility is ludicrous. It validates prioritizing athletics over academics.

**Recommendation 4 – Adopt the Commonly Accepted Measure of Good Academic Standing**

To be eligible for athletics, a student should be required to attain a minimum cumulative GPA of 2.0 during all semesters in which the student attends the institution. Any athlete not meeting the 2.0 standard can participate in practice no more than 10 hours per week, may be prohibited from traveling with the team or engaging in other team activities, and may be required to participate in an academic support program.

<table>
<thead>
<tr>
<th>ACADEMIC CLASS</th>
<th>NCAA CONTINUING ACADEMIC ELIGIBILITY REQUIREMENTS</th>
</tr>
</thead>
</table>
| FRESHMAN             | • Must be enrolled in **12 credit hours** at all times to compete and practice  
                      | • Student-athletes must complete a minimum of 6 hours in the previous full time regular academic term  
                      | • Student-athletes must complete a minimum of 18 hours during the regular academic year (fall & spring) |
| SOPHOMORE (entering 3rd semester) | • Must have earned at least 6 credits each semester  
                      | • Minimum of 18 credit hours must be earned during the fall and spring semesters  
                      | • Student-athletes must earn a minimum of 24 credit hours (can use summer school hours to meet 24)  
                      | • Developmental or remedial hours used to meet 24 credit hour rule cannot be used to satisfy credits toward degree  
                      | • 90% (1.8 GPA) of minimum cumulative grade point average for graduation each semester |
| JUNIOR (entering 5th semester) | • Must have earned at least 6 credit hours each semester  
                      | • Must have earned at least 18 credit hours during the regular academic year (fall & spring)  
                      | • Must have officially declared a major with paperwork on file in the Registrar’s office and entered in Banner system  
                      | • 95% (1.90 GPA) of minimum cumulative grade point average for graduation each semester  
                      | • 40% of degree must be completed  
                      | • Graduation audits must be completed prior to the end of the 6th semester |
| SENIOR (entering 7th semester) | • Must have earned at least 6 credit hours each semester  
                      | • Must have earned at least 18 credit hours during the regular academic year (fall & spring)  
                      | • 100% (2.00 GPA) of minimum cumulative grade point average for graduation each semester  
                      | • 60% of degree must be completed |
| 5TH YEAR SENIOR (entering 9th semester) | • Must have earned at least 6 credit hours each semester  
                      | • Must have earned at least 18 credit hours during the regular academic year (fall & spring)  
                      | • 100% (2.00 GPA) of minimum cumulative grade point average for graduation each semester  
                      | • 80% of degree must be completed |

- All student-athletes must be considered in good standing as defined by their major department/college
- Once a student-athlete has officially declared a major, all applicable hours used towards meeting the satisfactory progress requirements must be applicable toward the student’s designated degree program

- Remedial or developmental hours may count as part of the required 24 hours during the first year of college attendance, but may not be used to meet the “percentage of degree” eligibility requirements.
- “Elective” hours can be counted as degree hours only if the student’s degree program allows for electives.
- Hours cannot be earned for a repeated course that was previously passed.
- Hours cannot be earned for a class passed with a “D” if the major requires the course be passed with a “C” or higher.
- Hours toward a minor can be used for eligibility **only if a minor is required** for the student’s degree granting program.
- “Percentage of degree” requirements and grade point average also apply to transfer students.

**Graduation Rate Measures**

An important difference distinguishes the Federal Graduation Rate (FGR), which is part of the Higher Education Act (HEA) of 1972, from the Graduation Success Rate (GSR), which the NCAA developed. The FGR applies to all students, whereas the GSR applies only to athletes, allowing no comparison to non-athlete peers. An institution’s FGR is tabulated as the number of fall semester, full-time freshmen
students in an entering cohort who eventually graduate from their original institutions within six years, divided by the number of students in the original entering cohort. The HEA requires all institutions that participate in federal student aid programs to use the GSR to disclose graduation rates for the student body and to disaggregate the data by gender, race, and ethnicity...14

The HEA disclosure requirements also apply to schools that offer athletically related student aid in any form. Thus, the FGR for athletes, whether used to examine the FGR for an entire athletic program or a particular team, includes only athletes who receive athletically-related aid. All students in the athlete FGR cohorts must be first-time, full-time freshmen entering in a given fall term while receiving athletically related financial aid.15 College athletes who do not receive such aid at entry or who transfer into the institution are excluded from the cohort. Whether for athletes or non-athletes, the retention of all students who were admitted and who persisted to graduation is the most important measure of institutional success.

Admittedly, the FGR is limited because it includes only students who enter college in the fall as first-time, full-time undergraduates. Still, it is the only nationally available graduation measure that permits a comparison between the academic success of recruited athletes who receive athletic financial aid and that of their non-athlete counterparts. The NCAA does not use this measure, though. Instead, it developed and uses the Graduation Success Rate (GSR), which it insists measures academic success more effectively.

The GSR includes only those athletes who receive athletic financial aid or recruited athletes from Division I institutions that do not offer athletic related aid. It removes from the calculation for an institution any athlete who left the institution academically eligible to continue athletics participation at the original institution if the athlete had remained there (termed “left eligible”). It includes in the calculation for an institution any athlete who transferred to that institution and received athletics-related aid. As a result, nearly 40 percent more students figure into the GSR than are part of the federal calculation and the GSR is roughly 20 percentage points higher at most institutions than the FGR. However, the GSR lacks a comparison measure for the non-athlete portion of the student body. Further, the GSR is even more flawed than the FGR. The GSR adjusts institutional rates for “Transfers Out” even though institutions have no means of verifying that athletes who leave the institution actually graduate.

The GSR calculation inflates its graduation rates by removing from a school's cohort all athletes who leave while academically eligible for sports participation. It also adds to the cohort athletes who transfer in from other schools. The NCAA contends “student-athletes who depart a school while in good academic standing, Left Eligibles (LEs) ... are essentially passed from that school's cohort to another school’s cohort”.16 This implies that almost all LEs will become “Transfers-In.” But this is not the case. What the NCAA does not acknowledge, is the fact that the number of Transfers-In is significantly smaller than the number of LEs (see below). Most Left Eligibles are not passed to another school's cohort, but rather remain unaccounted for college dropouts. This is not a small number and causes the GSR rates to be significantly inflated.

Tellingly, the NCAA does not make public GSR data or calculations for FBS football and men’s basketball, sports in which public concern about athlete exploitation is the greatest. It only provides aggregated data

15 20 U.S.C. § 1092 (e) and 34 § CFR 668.48
16 NCAA, “How are NCAA Graduation Rates Calculated?” (November 2015), pg. 6 http://www.ncaa.org/sites/default/files/How%20is%20grad%20rate%20calculated_nov_2015.pdf
for all Division I sports, male and female.\textsuperscript{17} For example, the cohort comprised of the 2006-2009 entering classes (the latest available GSR calculation), the total number of athletes is 95,782 and the GSR is 84%. What the NCAA conveniently ignores is that its dataset includes 23,112 LEs, but only 8,165 Transfers-In. In other words, there are 14,947 more LE’s than transfers-in. Astoundingly, about 65% of all LEs are unaccounted for in the NCAA’s graduation “success” data.\textsuperscript{18} The NCAA metric is inaccurately reporting the academic success of athletes who leave by absolving the original schools of responsibility for failing to retain them. Because it adjusts for transfers out, the GSR also encourages institutions to push out athletes who might not graduate or who are easily replaced.

To make matters worse, the GSR is inflated compared to the FGR because athletes are required to be full-time students progressing toward a degree, making them more likely than non-athletes to graduate in six years. The FGR, on the other hand, has a lower rate because it includes many entering full-time students who must work and who often drop down to part-time status and take longer to graduate. The GSR also includes 11,000 Ivy League and Military Academy students who (1) do not receive athletic related aid, (2) are not admitted as athletes, and (3) are considered properly as regular students in the FGR. Finally, use of the GSR to represent athletes’ graduation success overall is misleading because female athletes graduate at significantly higher rates than male athletes. The GSR masks the significant academic underperformance of male athletes.

Thus, the NCAA has created a graduation measure that misleads the public into thinking that athletes graduate at higher rates than the general student body. See Table 1 on the next page, which compares FGR and GSR data using 2015 NCAA Division I Final Four Basketball Championship as an example.

</table>

Note that this data is based on the most recent six-year 2007 cohort and that the 4-year student body and men’s basketball percentages represent an average of the last four years.
Despite this masking of low graduation rates at individual institutions, the NCAA regularly trumpets the results of aggregated GSR data to argue that overall, college athletes perform better than non-athletes in the classroom. For the most recently available six-year cohort (2007), the NCAA reports a 66 percent Federal Graduation Rate (FGR) for athletes nationwide compared to a 65 percent FGR for all students and an 82 percent NCAA Graduation Success Rate (GSR). By not reporting the progression of all athletes who leave the institution, and by allowing numerous other adjustments to mitigate low graduation rates (such as not counting against an institution’s total an undergraduate who leaves to join a professional team), the GSR fails to measure graduation rates accurately.

Beyond overstating college athletes’ graduation rates, the GSR blinds the higher education community to critical issues. For instance, Bimper notes that of the 70 colleges and universities that competed in football

---

bowl games after the 2012 season, more than half had a 20-percentage-point gap between the graduation rates of Black and White athletes, respectively. One quarter of all teams had a 30-percentage-point gap. In another example of the critical value of being able to compare the academic performance of athletes to that of the general student body, Harper, Williams and Blackman found:

- Between 2007 and 2010, Black men were 2.8% of full-time, degree-seeking undergraduate students, but 57.1% of football teams and 64.3% of basketball teams.
- Across four cohorts, 50.2% of Black male student-athletes graduated within six years, compared to 66.9% of student-athletes overall, 72.8% of undergraduate students overall, and 55.5% of Black undergraduate men overall.
- Among NCAA Division I colleges and universities 96.1% graduated Black male student-athletes at rates lower than student-athletes overall.
- 97.4% of all FBS institutions graduated Black male student-athletes at rates lower than undergraduate students overall. On no campus were rates exactly comparable for these two comparison groups.
- At one university, Black male student-athletes graduated at a rate comparable to that of Black undergraduate men overall. On 72.4% of the other campuses, graduation rates for Black male student-athletes were lower than rates for Black undergraduate men overall.

Equally distressing is that athletic programs with the most financial resources can manipulate the GSR to their advantage. For instance, an institution can push out an unwanted (from a talent perspective) and academically weak basketball or football athlete by combining a threat with an incentive. The institution informs the player that it will not renew his or her financial aid, but it dangles the offer of a full release to enable the athlete to transfer to another institution if the athlete attends summer school and raises a deficient GPA enough that the current institution will not suffer a GSR (or APR) loss. This ploy is most prevalent in football and men’s basketball, sports in which recruiting underprepared athletes is common due to the financial payoff from winning. Even without such summer school and transfer shenanigans, richer athletic programs can afford a cadre of academic support staff devoted to keeping athletes eligible to play.

Worse yet, the mechanisms used to ensure that underprepared athletes remain eligible frequently involve academic fraud and misconduct such as (1) counseling athletes to select the least demanding academic majors, (2) counseling athletes to register for the least demanding academic courses or courses conducted by professors with lax grading reputations, (3) creating intensive tutoring programs that raise questions whether the work produced is the athlete’s or the tutor’s, (4) using athletic-department funds to support academic departments that enroll many athletes in their courses, and (5) counseling athletes to register

---

for independent study courses with professors who require a minimal work product. Athletic departments, not campus academic units, often operate these one-to-two-million-dollar-per-year academic support programs, which lack management or oversight by tenured faculty. One need only examine the FGR and GSR rates of HBCUs to recognize the impact of financial resources on athlete graduation rates and on continued eligibility prior to transfer.

Recommendation 5 - Abandon the GSR

The NCAA should discard the GSR as a metric based on its poor statistical reliability and validity. But the NCAA should not invent its own academic metric designed to portray the academic performance of athletes in a better light than the data support. The NCAA must follow its own statement of sound academic principles by using “consistent standards adopted by the institution” for the student body in general. Higher education should commit to measuring the academic success of athletes and non-athletes by means of the same instrument. The GSR has no comparable non-athlete measure; therefore, it prohibits a comparison to college athlete peers.
**Academic Progress Rate (APR)**

Established in 2003 and enforced beginning in 2005, the APR is a direct measure of retention and an indirect measure of scholarship athletes’ academic eligibility, including both minimum grade point average and satisfactory progress toward a degree. It is also a real time predictor of GSR, the NCAA’s inflated graduation metric. “Each student-athlete receiving athletically related financial aid earns one retention point for staying in school and one eligibility point for being academically eligible. A team’s total points are divided by points possible and then multiplied by one thousand to equal the team’s Academic Progress Rate score.”

Teams failing to achieve the minimum APR requirement, which has been increased from an initial standard of 900 to 930 in 2014-15, are declared ineligible for post-season championship play, and a three-level penalty system corresponding to each consecutive year in which the benchmark is unmet is imposed:

- **Level One**
  Team is limited to 16 hours of practice a week over five days, with the lost four hours to be replaced by academic activities, representing a reduction of four hours and one day per week of practice time.

- **Level Two**
  Competition reductions, either in the traditional or nontraditional season, added to the first level penalties.

- **Level Three**
  Penalty options as determined by the NCAA Committee on Academic Performance. Options include coaching suspensions, financial aid reductions, and restricted NCAA membership.

Thus, like the GSR, the APR is flawed in that athletic programs with significant financial resources are better able than less affluent institutions to keep athletes eligible through manipulation of the existing rules. Larger, wealthier institutions also provide additional course offerings, which may allow for an easier pathway to a degree at such institutions. For large-roster teams like football, affluent institutions can increase their APR scores by recruiting some academically gifted players to compensate for those who are not. The NCAA has received heavy criticism about the lack of affluent, high-profile Football Bowl Subdivision teams among those penalized for failing to meet the APR benchmark. Besides directing athletes to easy courses and majors and providing excessive tutoring help, these institutions manipulate the APR by means of:

- **Extensive Use of Summer School Financial Aid.** Liberal use of summer school financial aid to boost athlete GPAs and ensure that transfers leave with GPAs that do not cause APR point losses is commonplace among the highly resourced FBS institutions, but less of an option for the HBCUs and smaller Football Championship Subdivision and Division I non-football institutions.

- **Learning Disability and Other Waivers.** Athletes who fail to meet initial eligibility standards and can demonstrate a learning disability will often be exempt from meeting standard initial eligibility requirements through an initial eligibility waiver. The NCAA may also waive the requirement to maintain a full-time academic load of 12 credit hours. A successfully written progress-toward-

---

25 It should be noted that an institution can appeal this penalty due to unusual circumstances.
A degree waiver can often allow athletes with certified learning disabilities who fail to meet NCAA standards to be granted continuing eligibility by passing enough degree-applicable credit hours. It takes highly skilled staff to maximize these opportunities. As Gurney and Southall revealed:

Navigating this educational landscape is a bureaucratic challenge for many NCAA institutions. However, the disparity between compliance staffing at FBS schools and "limited-resource" HBCU institutions is enormous. For example, the University of Oklahoma staff consists of 11 professionals, including several lawyers. The University of Southern California is similarly staffed with 11 compliance officers. The University of Alabama maintains a staff of eight. The University of Texas' Risk Management and Compliance Services staff has seven full-time professionals. Conversely, limited-resource universities must make due with almost nonexistent staffs. For example: Arkansas-Pine Bluff has a total of two compliance staff, Hampton University has a single compliance staff "coordinator" and a total of three full-time academic support staff and Mississippi Valley State University has only one compliance officer.

As a result of their personnel largess, "un-limited-resource" institutions have staff whose primary duties involve writing admissions waivers and exceptions, as well as monitoring athletes' satisfactory progress toward degree. At one Big 12 institution, a typical year's waiver writing assignments for a compliance attorney included one initial eligibility waiver and up to seven reduced-hour or other progress-toward-degree waivers and exceptions. Having someone specifically assigned to these tasks is necessary in order to make certain the institution does not suffer embarrassing penalties or fail to compete in postseason competition. Overworked and understaffed, HBCU athletic departments simply lack the human resources to address these issues. Being overwhelmed by the minutia of NCAA eligibility paperwork, they find it impossible to even address waivers.26

- **Medical and Missed Term Exceptions.** Two common exceptions for satisfactory progress primarily used to manipulate APR scores are the medical exception and the missed term exception. “Athletes or members of their families who become ill with incapacitating injuries or illnesses may also escape APR eligibility penalties through being granted an exception. Athletes who experience depression or suffer other mental illness may avoid progress-toward-degree consequences by withdrawing from classes or dropping down to a part-time academic load. Alcoholism, depression or substance abuse, for example, may be considered an incapacitating illness. The missed term exception permits an athlete to miss one or more semesters one time during their career if they leave eligible. The missed term exception may be used even if the athlete’s absence is due to a suspension for academic dishonesty if they were eligible prior to the absence.”27 Again, processing such appeals takes considerable staff time.

- **Supporting Non-Graduates’ Return to School.** Affluent schools also manipulate APR scores by providing financial aid to non-graduates who have exhausted their athletics eligibility so they can return to the institution and earn their degrees. Such degree-completion programs may not be feasible for underfunded athletic programs. An example of the benefits of institutional affluence

---

27 Ibid.
is the University of California at Berkeley, which recently implemented a Degree Completion Program (DCP) for athletes who had exhausted their eligibility without obtaining a degree.\textsuperscript{28} For many institutions, degree-completion programs are not economically feasible because of the escalating costs associated with running athletics departments.

However, the most serious flaw of the APR is that it is not the metric it purports to be. The 900 APR was supposed to correspond to a FGR of 50%. Even the recently elevated 930 APR is nowhere near reflecting a FGR of 50%. When the NCAA realized the 900 APR standard was nowhere near the goal metric, instead of adjusting the APR to correspond to a 50% FGR, it pegged the APR to a 50% GSR that only approximates a 40% FGR. This is a “bait and switch” of the worse kind. Arguments that the GSR takes into consideration athletes leaving in good academic standing and athletes who transfer into an institution, and that it encompasses a larger percentage of athletes cannot and should not hold any weight if comparisons to the general student body are impossible.

As a result, since the introduction of the GSR, NCAA athletes’ reported graduation success has dramatically increased. What has been lost amid the NCAA’s public relations campaign is the continued existence of large (30-40 percent) negative graduation gaps between NCAA Division I football and men’s basketball players and the general student population. In some cases teams report graduation rates of zero. Simply put, the athletes on whose skill the entire commercial enterprise depends, college football and men’s basketball players, are dramatically less likely than other students to obtain a degree. This is to say nothing about the quality of the education to which they have access.

By consistently simply asserting the GSR “more accurately assesses the academic success” of college athletes and steadfastly referring to GSR rates, NCAA members have convinced the media to almost exclusively use the new, more-favorable metric. Intentionally or not, the NCAA’s APR and GSR metrics confuse the media, fans and the general public. Using the GSR and APR to tout graduation success and increased academic standards is undoubtedly savvy marketing and public relations, but these metrics are fundamentally nothing more than measures of how successful athletic departments are at keeping athletes eligible, and have increasingly fostered acts of academic dishonesty and devalued higher education in a frantic search for eligibility and retention points.\textsuperscript{29}

If the FGR is used instead of the GSR, exceptions should not be allowed for several reasons:

1. No FGR exclusions are permitted for members of the general student body who experience family issues, medical issues, and learning disabilities.

2. Athletes have a huge retention advantage compared to the general student body in that they are required to be full-time students and they receive financial aid so they do not have to work. Furthermore, athletes benefit from sophisticated academic support programs. The FGR does not reflect such general student advantages; indeed, it is artificially low as a comparable standard because

\begin{thebibliography}{9}
\bibitem{29} Ibid.
\end{thebibliography}
many initially full-time students drop down to part-time and are unable to graduate in six years, but must still be counted.

3. Some commentators argue that the FGR should be adjusted if the athlete returns to school after six years and graduates. But many non-athlete students do the same, yet the FGR is not adjusted. The FGR is useful because institutions cannot easily tamper with it; that is precisely why the NCAA should adopt it. It will thwart athletic-department gamesmanship.

Thus, to further advantage athletes with exclusions or exceptions to the FGR is unjustified.

Lastly, because the APR is pegged to retention and current eligibility to compete, any penalty imposed on a current team (i.e., banning the team from post-season play) for failures of previous members of the team penalizes students who are not responsible for the benchmark failure. The institution, not the athletes, should suffer the penalty.

**Recommendation 6 - Discard the APR as an Academic Metric, Establish the FGR as the Proper Metric to Impose Coach and institutional Penalties and Require Mandatory Five Year Scholarships**

The APR should be discarded because its original purpose was to be a real time predictor of GSR, which is a flawed metric for the reasons discussed above, most notably that it does not compare the academic performances of athletes and non-athletes. Besides being easily manipulated by affluent institutions, the APR, in eliminating teams from post-season play, unfairly penalizes less affluent institutions and current athletes who are not responsible for their institutions’ failure to recruit academically prepared athletes. Enforcement of the higher 2.0 cumulative GPA standard for athletic eligibility (see Recommendation 4) is sufficient to maintain the integrity of regular season and post-season championship eligibility. The 2.0 cumulative GPA properly holds the athlete accountable for his or her academic responsibilities, with loss of individual eligibility for competition as the proper penalty. The FGR can hold institutions and coaches accountable for fulfilling the promise of an education to the athletics they recruit.

Thus, the NCAA should establish a rule that requires each sport program of a member institution to compute and maintain an FGR, without any exceptions for athletes, that equals or exceeds the national average FGR or the institution’s own FGR, whichever is lower. Failure to achieve this benchmark should NOT be used to declare a team ineligible for post-season play. Rather, institutions should absorb the penalties for such failure, which penalties should increase if benchmark failure continues for consecutive years:

**First Year**

The institution is prohibited from receiving 25% of (a) any national championship, bowl or other post- or pre-season NCAA sponsored or sanctioned event media rights fees, sponsorships, advertising, licensing or gate receipt revenue distributions in that sport, (b) any conference regular season or championship media rights fees, sponsorships, advertising, licensing or gate receipt revenue distributions in that sport and (c) any non-sports specific NCAA revenue distributions. The institution may not decrease academic support program expenditures.
The institution is prohibited from receiving 50% of (a) any national championship, bowl or other post- or pre-season NCAA sponsored or sanctioned event media rights fees, sponsorships, advertising, licensing or gate receipt revenue distributions in that sport, (b) any conference regular season or championship media rights fees, sponsorships, advertising, licensing or gate receipt revenue distributions in that sport and (c) any non-sports specific NCAA revenue distributions. The institution may not decrease academic support program expenditures.

Because more than 1100 institutions offer academic programs of varying academic rigor, the institutional comparator FGR is of critical import. The optional use of the national average FGR in lieu of the institutional FGR gives reasonable leeway to highly selective institutions. Use of the FGR, which emphasizes athlete retention and graduation from one’s original institution, will reduce the current practice of discarding athletes for whom an institution finds more talented replacements. Most importantly, it will require institutions to recruit student-athletes capable of competing academically with other students attending and graduating from that institution. This standard will create academic expectations of athletes that are equal to those the institution has for the rest of the student body.

Key to desired effect on graduation is to replace the current option of guaranteeing athletic scholarships for five years with a requirement that athletic scholarships be guaranteed for five years. Institutions must be encouraged to recruit athletes who are capable of graduating and to invest in athletes’ academic success for the duration of their college careers.

The Coaches’ Academic Progress Rate

In 2010 the NCAA established the Coaches’ Academic Progress Rate. Established by the Committee on Academic Performance at the request of the Division I Board of Directors, the database aims “to create more transparency in the Academic Performance Program and strengthen the accountability of coaches for the academic performance of their student-athletes.” The Head Coach APR Portfolio includes the single-year team APR for a head coach at each institution where he or she has held that post, along with the average single-year APR in the coach’s specific sport for comparison purposes. Interim head coaches are not included in the database.

The current NCAA coaches’ metric is fundamentally flawed because:

- The coach is evaluated based on the academic progress of athletes recruited by others as well as the academic progress of athletes the coach recruited himself or herself.
- The APR metric is pegged to the NCAA Graduation Success Rate, itself a flawed metric for reasons already stated.

**Recommendation 7 – Adopt the Proper Coach Metric**

The NCAA should abandon the Coaches’ Academic Progress rate as currently constructed and should replace it with a Coaches Graduation Rate. A coach should be held responsible for the academic success and graduation of every athlete that coach recruits, earning a 1.0 for every recruit who graduates within six years of initial enrollment from the institution to which the coach recruited him or her. That number would be divided by the total number of athletes recruited. The institution should be required to publish the Coaches’ Graduation Rate for each head coach or former head coach (i.e. one who has been fired or has moved to another institution) in its program.

**Transparency of Academic Metrics**

Academic integrity in intercollegiate athletics requires a system of checks and balances and transparent academic metrics. These safeguards will ensure that learning occurs, not just that athletic eligibility is maintained.

Institutions often use the Federal Education Rights Protection Act (FERPA) to hide evidence of academic corruption and exploitation of football and men’s basketball athletes from public scrutiny, while releasing only good news. They will release information about the A student, but will not discuss the number of athletes clustered in an eligibility-friendly major. FERPA has also enabled institutions to deny knowledge of academic misconduct committed by-athletic department staff, coaches, and even faculty members. The public cannot evaluate claims of academic improvement without knowing the classes that players take, the names of instructors, and overall course and team GPAs. Thus, true academic reform cannot occur without public accountability.31

A careful reading of FERPA shows that only identifiable educational information is prohibited from being disclosed.32 Dr. Jon Ericson, former Provost at Drake University, and attorney Matthew Salzwedel have presented a plan for academic disclosure that would comply with FERPA. In their article entitled “Cleaning Up Buckley: How The Family Educational Rights and Privacy Act Shields Academic Corruption In College Athletics,” they argue that The Buckley Amendment allows an appropriate level of academic disclosure regarding college sports, which disclosure will shame institutions into changing their behavior.33

---

31 Splitt
A sound academic disclosure plan should not disclose individual athlete academic information. Academic disclosure is about institutional behavior; namely, the complicity of administrators and faculty in academic corruption and the resulting denial to many college athletes of a meaningful college education. Institutional resistance to full disclosure has occurred in past academic scandals, most notably at Auburn University and the University of North Carolina. Both universities were embarrassed, and both made positive changes once their “eligibility manipulation” became public, albeit after some kicking and screaming. Faculty and others who desire to provide bona fide educational opportunities for college athletes need an effective tool for achieving that end. History shows that public humiliation prompts universities to operate with integrity.34

The NCAA currently requires athletes to consent to share their academic information with institutional employees who are responsible for determining eligibility. That same requirement should apply to the disclosure of that information, as long as such disclosure does not reveal the identity of the athlete. Because disclosure would not reveal athletes’ names, no harm would occur to any individual student, nor would anyone’s privacy be invaded. Such use would be in keeping with the letter and spirit of FERPA. Yet, the aggregated use of individual data would expose institutional misbehavior by identifying athletes’ course selections, their choices of professors and academic majors, their advisors, and team GPA’s. Without identifying any student by name, this information would expose academic clustering, suspect courses, and issues like those that occurred at Auburn and the University of North Carolina.

Recommendation #8 - Academic Disclosure

The NCAA should require every member institution to establish an academic check and balance system consisting of an Academic Oversight Committee comprised of tenured faculty, a peer review certification program, and regularly issued public reports. At each institution, members of the faculty senate or the highest faculty governance authority would elect the Academic Oversight Committee. This committee would meet annually with the head coach of each team to review the academic progress of all athletes on that team. The committee would be required to report to the faculty senate (or other highest faculty authority) annually on the academic progress and admission qualifications of college athletes and, when possible, to compare athletes to non-athletes. The methods of comparison would include average SAT and ACT scores by sport, Federal Graduation Rates by sport, independent studies taken by sport, the professors offering the independent studies and their average grade assigned, admissions profiles, athletes’ progress toward a degree, trends in selected majors by sport, average grade distributions of faculty by major, incomplete grades by sport, grade changes by professors, and the name of each athlete’s faculty advisor.

The NCAA certification program, which included a more comprehensive examination of athletic programs’ academic elements than that conducted by the regional accreditation agencies, was discarded in 2010, but the Association should reinstitute it. This program would require each Division I institution to undergo an athletics certification process at least once every ten years. That process

34 Ibid
should include peer review, by an external body funded by the Association, of a campus-wide self-evaluation conducted by various institutional committees assembled for that purpose. A majority of the members of these campus committees should be tenured faculty members.

Each NCAA member institution should also make public an annual report, to include the following data:

a. certification status of each member institution;
b. federal graduation rate for all students, all athletes, athletes by sport, and for all athletes admitted with a waiver of admissions standards;
c. number of recruited athletes required to complete one year in residency prior to initial eligibility;
d. number of recruited athletes admitted to the institution with a waiver of published admissions standards compared to the number of students overall receiving such admissions; and
e. Coach Graduation Rates of all head coaches employed by the institution.

What Changes May Result from the Adoption of these Recommended Academic Metrics and Recommendations?

Assuming the eight recommendations are adopted in their entirety, the following outcomes are anticipated:

1. Coaches will be more likely to recruit academically qualified athletes who will be eligible in their first year of college.

2. Coaches will be less likely to pressure marginal athletes to transfer because of the negative impact of that practice on the Coach’s Graduation Rate.

3. Athletes eligible as freshmen will possess adequate reading, writing, and math skills and will be more likely to compete with their non-athlete peers in the classroom.

4. Athletes not eligible as freshman will receive the remedial education necessary to remedy their academic deficiencies, the promise of financial aid, and continuing academic support throughout their five-year tenure at the institution. Therefore, they will be more likely to graduate from the institution that recruited them.

5. Athletes not eligible as freshmen will not be required to enroll in a full-time program of college coursework that counts toward a degree or to earn a minimum GPA. Yet they will be able to receive a remedial education, diminishing the institutional temptation to commit academic fraud in order to meet athletic eligibility and satisfactory progress requirements.

6. The graduation rates of athletes currently underperforming in more selective institutions of higher education will improve.
7. Highly selective institutions will be less likely to exploit underprepared football and basketball players even when they waive normal admissions standards to recruit those players.

8. Academic data on the academic progress of college athletes will be more transparent, facilitating evaluation by faculty, administrators, and the public.

CONCLUSION

The NCAA’s GSR and APR, or any metric that assumes college athletes are unique and should be treated as academically distinct from the rest of the student body, invites the exploitation of athletes and violations of academic integrity. When no comparator metric to the non-athlete student body exists, no “speed limit” is available to keep athletic programs honest. Unless academic standards for athletes are anchored to institutional academic standards and expectations for all students, athlete academic standards will float with the tide of institutional greed. The standard for athletes will become the one that will allow coaches and institutions to attract the most talented athletes so they can win and prosper. On the contrary, higher education’s promise to any student, athlete or non-athlete, must be a meaningful education that satisfies legitimate standards set by the faculty and leads to good academic standing and graduation.

Furthermore, institutions must acknowledge the importance of matching the academic abilities of their athletes to the academic profile of the larger student body. If institutions continue to waive admission requirements for athletes or recruit athletes whose academic profiles do not match those of their non-athlete classmates, then institutions must remediate the academic skills of these athletes before allowing them to compete. Otherwise, athletes will suffer exploitation, as institutions trade in the promise of a meaningful education for the easiest majors and courses, resulting in continued athletics eligibility, but little or no preparation for life after the cheering stops.
